Abstract

The agricultural economics literature provides various estimates of the number of farms and small farms in the world. This paper is an effort to provide a more complete and up to date as well as carefully documented estimate of the total number of farms in the world, as well as by region and level of income. It uses data from numerous rounds of the World Census of Agriculture, the only dataset available which allows the user to gain a complete picture of the total number of farms globally and at the country level. The paper provides estimates of the number of family farms, the number of farms by size as well as the distribution of farmland by farm size. These estimates find that: there are at least 570 million farms worldwide, of which more than 500 million can be considered family farms. Most of the world's farms are very small, with more than 475 million farms being less than 2 hectares in size. Although the vast majority of the world's farms are smaller than 2 hectares, they operate only a small share of the world's farmland. Farmland distribution would seem quite unequal at the global level, but it is less so in low- and lower-middle-income countries as well as in some regional groups. These estimates have serious limitations and the collection of more up-to-date agricultural census data, including data on farmland distribution is essential to our having a more representative picture of the number of farms, the number of family farms and farm size as well as farmland distribution worldwide.

Keywords: family farm; small farm; farm size; smallholders; farmland distribution

This paper was prepared as background research in support of FAO's forthcoming *The State of Food and Agriculture 2014*. The report will be available at <http://www.fao.org/publications/sofa/en>. The authors are most grateful for the provision of agricultural census reports by the Statistics Division of FAO. Helpful feedback was received from numerous colleagues. In particular, the authors wish to thank Jairo Castano, Adriana Neciu, Terri Raney, André Croppenstedt, Cheng Fang, Michelle Kendrick, George Rapsomanikis, Kostas Stamoulis and Dominique Van Der Mensbrugge (FAO). Any errors and omissions are those of the authors.

1. Introduction

The agricultural economics literature provides various estimates of the number of farms and small farms in the world. Nagayets (2005) used agricultural census data from FAO to estimate that there are about 525 million farms of all sizes in the world. Other authors use similar data to maintain that there are about 500 million small farms (those with less than 2 hectares) (Hazell, Poulton, Wiggins, & Dorward, 2010) (IFAD, 2011).

This paper is an effort to provide a more complete and up to date as well as carefully documented estimate of the total number of farms in the world, as well as by region and level of income. It provides some estimates of the number of family farms, the number of farms by size as well as the distribution of farmland by farm size. These estimates find that there are at least 570 million farms worldwide, of which at least 500 million can be considered family farms.

Estimates are made using data from numerous rounds of the World Census of Agriculture (WCA), the only survey program which describes the entire farming sector for countries throughout the world in an internationally comparable manner. The WCA was first conducted in 1930 and FAO has promoted it since 1950. For the first six rounds (from 1930 to 1980) countries conducted the census in the same year, but for the 1990 census, this constraint was relaxed and countries conducted the census during the period 1987 – 1993 (FAO, 2005). The 2000 and 2010 rounds span the periods 1996 – 2005 and 2006 – 2015, respectively.

FAO works closely with many member governments providing guidance on methodology and contents for the agricultural census. Agricultural censuses are typically representative of all farms or farm households in a country; they are conducted by using complete enumeration and/ or sampling methods. FAO recommends the census include a core module on number of holdings and household size and status as well as 12 supplementary themes, which are: agricultural land; irrigation and water management; crops; livestock; agricultural practices; agricultural services; demographic and social characteristics; farm labour; household food security; aquaculture; forestry and management of the holding. Agricultural holdings and agricultural area reported by the census include crop and livestock production only; holdings engaged in forestry or fisheries are only included if they also are engaged in crop and livestock production. That is, when a country chooses to report on units which are purely used for forestry or fisheries, they are described separately and as part of the supplementary theme.

2. Limitations of the data and estimates

Problems arise when making international comparisons and global estimates using the agricultural census data, since information is not available for each indicator in every country and all decades. Furthermore, although the WCA provides a large degree of standardization among countries, there is naturally variation among countries in terms of how they define indicators.

For this paper we have chosen to combine estimates from numerous census rounds. We use the most recent observation we were able to reasonably locate for each indicator-country combination. This approach is by no means without fault, since, as the available data show us, the farm sector is dynamic and the number of farms in a country changes greatly over time.

Most of the data used in this paper was collected under the agricultural censuses' core module (number of holdings, household size and status), as well as the agricultural land and farm labor themes. It relies heavily on data presented in international comparison tables from the 2000 and 1990 rounds (FAO, 2013a) (FAO, 2001). For some indicators (such as total number of holdings) we were able to use results from the ongoing 2010 round. In examining the total number of agricultural holdings, recent estimates were not available for some countries and we used estimates from past rounds dating back as far as 1960.

The agricultural holding measure reported in national agricultural censuses is not without fault, but it is the best available proxy measure for estimating the total number of farms in the world. The FAO's theoretical definition of an agricultural holding is "an economic unit of agricultural production under single management comprising all livestock kept and all land used wholly or partly for agricultural production purposes, without regard to title, legal form, or size. Single management may be exercised by an individual or household, jointly by two or more individuals or households, by a clan or tribe, or by a juridical person such as a corporation, cooperative or government agency" (FAO, 2005). FAO encourages countries to use an operational definition based on this theoretical definition when carrying out their agricultural census.

Although the agricultural holding measure is largely standardized, thanks to the work of the WCA, it does nevertheless vary from one country to another. For example, most countries establish a threshold farm size above which farms are included in the census. The minimum threshold varies from one country to the next, and in some countries it can be extremely small. This means that when we report a total number of farms or agricultural holdings in the world, we are reporting the sum of variables which are not uniform.

In both China and India, the countries reporting the largest number of farms, very small farms are included in the census. In China in 2006 farms as small as 0.07 hectares were included in the census and slightly more than 200 million agricultural holdings were reported for the country (Government of China, 2009). In India in 2011, no minimum size was established and about 137 million holdings were counted (Government of India, 2012), whereas in Bangladesh farms were only included if they were larger than 0.2 hectares (Government of Bangladesh, 2010). Furthermore, some countries (such as Rwanda), report a number of agricultural households rather than agricultural holdings (Government of Rwanda, 2010). Clearly, there is wide variation among countries in terms of what is reported as an agricultural unit in the agricultural census.

Just as there is wide variation among countries in terms of what is considered an agricultural holding and included as such in the census, there is likewise variation within countries regarding what is considered an agricultural holding. For example, for its 2006 agricultural census, the Russian Federation reports several different types of agricultural holdings (Government of the Russian Federation, 2008). The vast majority of holdings (about 98 percent) are owned by private households and other individual operators; they represent only about 2 percent of the farmland in the country. Farms in the other categories of agricultural holding (agricultural enterprises, both small and large, institutional farms, private farms, individual entrepreneurs and non-profit citizen associations) represent only about 2 percent of the holdings in Russia, but about 98 percent of the farmland. The average farm size for the farms in the private household and other individual operator size is about

0.4 hectares, whereas it is far larger for the other categories. The Russian Census recognizes this heterogeneity and does not provide a total number of agricultural units for the country; it rather reports on different types of agricultural holdings separately. We have, however, chosen to consider all agricultural units enumerated by each country, including those in the Russian census.

Beyond variation in terms of what is counted as a farm, there is variation in what land size classes are used by countries in reporting the agricultural census results. The smallest land size class reported by many countries where average farm sizes are large, is less than 2 hectares; in many cases farms smaller than one hectare are included in that group. For example, we see in Annex 6 that in France there are 111,740 farms smaller than 2 hectares in size operating a total of 212,000 hectares of agricultural land. Such farms are reported in the cohort 1 – 2 hectares, with shading to indicate that an unknown number of them are in fact smaller than 1 hectare in size. A similar limitation applies to the farms in the larger farm size classes, particularly for countries where average farm sizes are relatively small. Again, referring to Annex Table 6, we see that in the Philippines the largest farm size class reported is 20 – 50 hectares where there are a total of 20,666 farms operating 1,072,845 hectares. The average farm size for this group is larger than 50 hectares and so we know that, as indicated by the shading in the table, some of the Filipino farms reported as being between 20 and 50 hectares in size actually belong to a larger farm size class. For some other countries similar interpolations have been made; details may be found referring to WCA documents (FAO, 2013a) and (FAO, 2001).

For these reasons it is important to stress that when we report a total number of farms or family farms, we are reporting a very rough estimate of the total number of very diverse entities; they include quite small operations which may be little more than a hobby for the owner whose main livelihood is based on off-farm income. Others may be small farms which provide a substantial share of the owner's income and/ or food consumption; and the owners may be subsistence farmers living in poverty or they may have an adequate income to provide for themselves and their family. As we know from other work, small farmers in developing countries earn income from several sources and off-farm income sources can also be quite important (Stamoulis & Rapsomanikis, 2012) (Rapsomanikis, 2014). Large scale industrial ventures are likewise included in the agricultural census and therefore in our total number of farms in the world. Given this diversity, we therefore strongly caution the reader that when we refer to a total number of farms in the world we are describing entities which vary greatly from one country to another as well as within each country.

Despite obvious weaknesses, we have chosen to use the agricultural unit as reported by the census as a proxy for the total number of farms. Throughout the rest of this paper we will use the word farm loosely –referencing the agricultural units reported in the national agricultural censuses considered – whether they be agricultural holdings or agricultural households.

3. How many farms are there in the world?

In order to estimate the number of farms in the world, we used information from 6 different WCA rounds dating back to 1960. We recorded the most recent estimate of the number of agricultural holdings for each country or territory for which an agricultural census has been carried out and for which a report was available. We report estimates of the number of farms in 157 of the 194 FAO member states as well as in an additional 10 non-member states. These 167 countries and

territories² represent 96 percent of the world's population; 97 percent of the population active in agriculture and 90 percent of agricultural land worldwide. The resultant estimate of the total number of farms in the 167 countries comes to nearly 570 million (Annex 1).

For numerous reasons, we may expect that the actual number of farms in the world is larger than this 570 million estimate. Firstly, no agricultural census which reported a total number of agricultural holdings was available for 37 FAO member states; including estimates from those countries would of course increase the total. Second, many of the estimates of number of farms for low- and middle-income countries are from old agricultural census rounds. For example, the last census for three of the countries (Brunei Darussalam, Nigeria and Zimbabwe) was conducted in 1960. Average farm size and the number of farms worldwide has increased from 1961 to 2000 (see section 6 on average farm size), largely due to increases in the number of farms in low- and middle-income countries, which represent the vast majority of farms worldwide. For these reasons we may conclude that the total number of farms has increased and that there are now more than 570 million farms worldwide.

Farm sizes and the total number of farms change greatly over time as a result of population growth, agricultural development, land policies and other factors. We might expect that in some countries the number of farms in past decades has little bearing on the current number of farms in those countries. Regardless, this is the most complete estimate available, and the vast majority of agricultural holdings were reported from more recent agricultural census rounds (1990, 2000 or 2010).

Of the 570 million farms, 74 percent are located in East Asia and the Pacific or South Asia (Figure 1). China alone represents 35 percent and India 24 percent of the 570 million farms. Nine percent of the farms are located in Sub-Saharan Africa and seven percent in Europe and Central Asia. Only 3 percent of the world's farms are located in the Middle East and North Africa. Farms in Latin America and the Caribbean each represent only 4 percent of the farm holdings.

The majority of farms are located in lower- or upper-middle-income countries, (representing respectively 36 and 47 percent of the 570 million figure); this largely results from the classification of India as belonging to the former and China the latter group (Figure 1). Thirteen percent of farms are located in low-income countries. Farms in high-income countries represent 4 percent of the world's farms.

² Because we are interested in the number of farms worldwide, we consider estimates of farms in all geographical entities, whether recognized as sovereign states or not. For ease of communication, from this point forward the paper refers to number of "countries" used in various calculations without drawing the distinction among actual geographic areas that are widely recognized as sovereign states and those that might be considered as territories of sovereign states.

Figure 1: Share of farms worldwide, by country group, most recent observation

Notes: Number of countries included are shown in parentheses. Country regional and income groupings are the same as those used by the World Bank (2011). * Only 161 of the 167 countries with observations are classified by the World Bank groupings. Sources: Various from FAO. For details see Annex 1.

4. What is family farming?

There is no universally agreed definition of family farms, although various stakeholders have established definitions either for purely analytical purposes or for the implementation of government programmes. The term is most commonly used in countries of Latin America and the Caribbean as well as in high-income countries, including the United States and some European countries. In many instances the term is used more or less interchangeably with that of smallholders (Garner & de la O Campos, 2012). There is wide variation among definitions of family farms, with some national definitions being more restrictive than others.

The official Brazilian definition of a family farm is, for example, very different from that used by the United States. In short, the Brazilian definition of the family farm focuses on less affluent farms, while the US definition includes farms of all sizes, ranging from farms with low levels of revenue to farms that are multi-million dollar enterprises (FAO, 2013b).

In Brazil, a farm is considered a family farm if: the owner manages it with his or her family; it is smaller than 4 fiscal modules (one module may be between 5 and 110 ha depending on the locality); it relies mostly on family rather than hired labour; and the majority of household income is derived from the family farm. The definition can apply to some farms that are collective property as long as they don't exceed a certain size limit (FAO, 2013b). The family farm category is used for targeting of programmes as well as in the country's agricultural census. The census shows that most of Brazil's farms are family farms (Table 1). They are smaller than non-family farms (averaging 18 hectares and 309 hectares, respectively), and they have a far lower average value of agricultural production than do non-family farms (13,884 R\$ and 126,628 R\$ respectively). Although 84 percent Brazilian farms are family farms, they only represent 24 percent of farmland area and 38 percent of the value of agricultural production in the country (Government of Brazil, 2006).

Table 1: Extent of family and non-family farms in Brazil

	Number of farms	Average farm size (hectares)	Average value of agricultural production per farm (R\$)	Share of farms	Share of land area	Share of value of agricultural production
				Percentage		
Family farms	4,367,902	18.4	13,884	84.4	24.3	37.5
Non-family farms	807,587	309.2	126,628	15.6	75.7	62.5
Total	5,175,489	63.8	31,283	100	100	100

Source: Adapted from (Government of Brazil, 2006).

A less restrictive definition of family farms is used for analytical purposes (not as a criterion for targeting programmes) by the Economic Research Service (ERS) of the United States Department of Agriculture. Family farms are defined as agricultural businesses where the operator and his or her relatives own the majority of the business; all other farms are considered non-family farms. In its most recent analysis ERS considered 97.7 percent of US farms to be family farms. The ERS also groups family farms by the size of their revenues. Small family farms are those with revenues less than 350,000 US\$. Family farms with annual revenues between 350,000 and 999,999 US\$ are considered midsize while farms with revenues exceeding 1 million US\$ are considered large-scale (Hoppe & MacDonald, 2013).

The vast majority (90 percent) of US farms are classified as small family farms, based on their revenue (Table 2). Most of them are classified as "retirement or off-farm occupation" farms, indicating that the owner is currently engaged in or retired from off-farm work which is or was his principal source of income. Small family farms where farming is the chief occupation of the holder (designated as "farming-occupation") represent 30 percent of the farms in the US but only 15 percent of the value of the country's agricultural production. Eighty percent of US agricultural production, in value, results from agricultural production by mid-size and large-scale family farms as well as non-family farms, three farming categories which represent less than 10 percent of the countries' farms (Hoppe & MacDonald, 2013).

Table 2: Family farms by type in the United States, 2010

Farm type	Revenues (Gross cash farm income)	Total number of farms	Share of farms	Share of value of agricultural production
			Percentage	
Small family farms		1,975,386	90.1	21
<i>Retirement or off-farm occupation</i>	<i>Less than 350,000 US\$</i>	<i>1,317,790</i>	<i>60.1</i>	<i>6.2</i>
<i>Farming-occupation</i>	<i>Less than 350,000 US\$</i>	<i>657,596</i>	<i>30.0</i>	<i>14.8</i>
Midsized family farms	350,000 - 999,999 US\$	123,748	5.6	25.8
Large-scale family farms	1,000,000 US\$ or more	43,929	2.0	40.9
Nonfamily farms	na	49,711	2.3	12.3
Total		2,192,774	100	100

Source: Adapted from (Hoppe & MacDonald, 2013).

Despite such variation among definitions of family farms, there are some commonalities. A survey of 36 definitions of family farms found that nearly all definitions of family farms specify that a member of the household owns, operates and/or manages the farm either in part or fully. Often the definition specifies a minimum share of labour that must come from the owner and his or her relatives. Many definitions limit the size of the farm explicitly by establishing a maximum land area for the farm, beyond which the farm is no longer considered a family farm. Some definitions require that the share of household income from non-farm activities not exceed a certain level (Garner & de la O Campos, 2012).

For the International Year of the Family Farm being celebrated throughout 2014, FAO has defined family farming as follows:

Family Farming (which includes all family-based agricultural activities) is a means of organizing agricultural, forestry, fisheries, pastoral and aquaculture production which is managed and operated by a family and predominantly reliant on family labor, including both women's and men's. The family and the farm are linked, co-evolve and combine economic, environmental, social and cultural functions. (FAO, 2013c)

5. How prevalent are family farms worldwide?

Information from national agricultural censuses can provide insights into the prevalence of some of the characteristics that commonly enter into the various definitions of family farms. International comparison tables are available describing such characteristics for some countries included in the 2000 round (FAO, 2013a). The sample sizes are small since many countries chose not to report such information in their census. We first consider whether the farm is owned by a family and next whether the labor is supplied by the family or by hired workers.

Most definitions of a family farm require the farm to be partially or entirely owned and/or operated by an individual and his relatives. The censuses report on ownership, but not operation of the farm. In most (all but four) of the 52 countries for which we have information (see Annex 2), more than 90 percent of farms are owned by a single individual, a group of individuals or a household, either with

or without a formal contract; in the four countries for which this is not the case between 80 and 90 percent of the farms are owned by households or individuals. Only a very small share of farms are owned by a corporation, cooperative, governmental institution, religious institution or an unknown arrangement. In contrast to the share of farms, the share of farmland owned by households or individuals is lower (averaging about 70 percent) in most countries, although this assessment is based on a small subset of 31 countries for which data was available (see Annex 2).

Several definitions of family farms also require the family to supply the majority of the labour. In a sample of 14 agricultural censuses, on average about 50 percent of the farm household engaged in some form of labour on the household's farm (Annex 3). The number of permanent workers hired to work on the farm is on average very small (far less than 1 per farm) for nearly all 55 countries and territories for which information is available. Comparing the number of permanent hired workers on the farm to the number of household members engaged in agriculture shows that (in a 31 country sample), family members outweigh hired permanent labour by more than 10 to 1 on average (FAO, 2013a). In many contexts, seasonal hired workers provide an important source of labour for farms, but data on seasonal hired workers are not available from agricultural censuses and there is variation among countries in terms of whether or not their data includes seasonal as well as permanent work by family members.

Although the sample is rather small, especially for land shares, this would suggest that more than 90 percent of the world's farms are family farms and that they control about 70 percent of the world's land. Non-family farms, which represent less than 10 percent of the world's farms, make up about 30 percent of the world's farmland (Annex 2). More simply stated, by family farms we are mainly referring to the world's smaller and medium-sized farms as well as some larger farms. Non-family farms are, on average, larger than family farms.

We may use this information, together with our estimate of the total number of farms worldwide, to provide a rough estimate of the total number of family farms worldwide. In the absence of more information on total labor provided by the family as opposed to that which is hired on both a seasonal and permanent basis, we assume that the majority of labor is provided by the family – as is by far the case in our 31 country sample (Annex 3). We assume that at least 90 percent of the world's more than 570 million farms are owned by an individual, small group of individuals or household, as was the case for our 52 country sample. Applying this share to the estimate of the total number of farms would suggest that there are more than 513 million family farms worldwide, or, for ease of communication: there are more than 500 million family farms in the world.

In summary, the evidence available from agricultural censuses suggests that most farms in most countries are owned by an individual or group of individuals and use mostly household labour. Thus according to most of the commonly used definitions, family farms are likely to be by far the most prevalent form of farming in most countries and contexts. These farms are smaller than non-family farms so as a group the proportion of land that they control is smaller than their share of the number of farms.

6. What do we know about average farm size?

Nagayets (2005) reported that average farm sizes decreased globally from 1960 through 1990. FAO (2013a) likewise reports that, on the global level, average farm sizes decreased from 1950 to 2000. Our findings are similar.

International comparison tables from the 2000 round allow us to consider average farm sizes for a sample of 106 countries for which estimates of average farm size are available for at least two of the census periods from 1960 – 2000 (see Annex 4). We first consider the trends at the country level, recording an increase (decrease) for any country where average farm size has consistently increased (decreased) from one period to the next allowing for only one exception over the period. The level of significance of the increase or decrease is not considered. We see that in most countries farm size has indeed decreased, with clear patterns according to income group (Table 3). In most low- and lower-middle-income countries farm sizes have decreased. A larger share of upper-middle-income countries have exhibited increasing average farm size and the majority of high-income countries have exhibited a clear increase in farm sizes. Patterns according to regional grouping are less evident.

Table 3: Number of countries exhibiting a decrease or increase in the average size of agricultural holdings, 1960 – 2000

	Decrease	Increase	Neither clear increase nor decrease
High-income countries	6	25	4
Low- and middle-income countries, by income group			
Low-income countries	12	2	1
Lower-middle-income countries	24	2	0
Upper-middle-income countries	19	5	1
Low- and middle-income countries, by regional grouping			
East Asia and the Pacific	9	1	0
Latin America and the Caribbean	18	7	2
Middle East and North Africa	10	0	0
South Asia	5	0	0
Sub-Saharan Africa	15	3	1

Sources: Author's compilation using FAO (2013a); for details see Annex 4.

To gain a sense of what trend is evident for the world as a whole, we take a weighted average of average farm sizes. Given the dynamics of farm size, the number of farms in many of the countries has changed dramatically from 1960 to 2000. For simplicity's sake, we choose a fixed weight over time, using the number of agricultural holdings reported in the country's most recent agricultural census as shown in Annex 1. This shows that worldwide, farm sizes have been smaller in the 2000s than they were in the 1960s. However, most of the decrease in size occurred from 1960 to 1980 and there is not a clear increasing or decreasing trend from 1980 to 2000 (Figure 2). This largely reflects the decrease in farm size in the low- and middle-income countries, where the majority of the world's farms are located. By contrast, average farm size in the high-income country group has increased.

Figure 2: Weighted average farm size, full sample and by income grouping

Notes: Total country coverage, by year, is indicated in parentheses; countries included vary from year to year, with a total of 106 countries included over the period 1960 to 2000. Source: Authors' compilation using (FAO, 2013a) for average farm size and Annex 1 for weights.

The average farm size worldwide is largely determined by countries with the largest share of the world’s agricultural land. In 2010 those with the largest share of the world’s agricultural area (measured as arable land plus permanent crops and permanent pastures) were, in decreasing order of magnitude: China, Australia, the United States of America, Brazil and the Russian Federation (Table 4).

Table 4: Five countries with the largest share of the world’s agricultural area

	Total hectares (in millions)		Share of the world's agricultural area (2010)
	1961	2010	
Agricultural area in the world	4,460	4,889	100%
China	343	525	11%
Australia	462	456	9%
United States of America	448	414	8%
Brazil	151	261	5%
Russian Federation	na	217	4%

Source: Author’s compilation using (FAO, 2014).

Although the 106 country sample considered in Table 3 and Figure 2 above covers much of the world’s farms, it excludes some large countries, including 3 of the 5 listed in Table 4 above. The countries excluded are: China, Australia and the Russian Federation. No information is readily available for average farm size in the Russian Federation, but we do have information for Australia and China.

Australia was excluded from the 106 country sample because its farms are so large (averaging in the thousands of hectares) compared to farms in other parts of the world that it appears to be an outlier. Considering it on its own (Figure 3) we see that average farm sizes have clearly increased from 1960 to 2000 in Australia; this lends greater evidence to the tendency for farm size to have increased in high-income countries as depicted in Figure 2.

By considering available information from the 2010 round of agricultural censuses as well as some additional sources, we are able to gain some insight, albeit limited, into the trends in farm size in China (Figure 3). We find that from 2000 to 2010 average farm sizes decreased slightly in China. However, evidence from sources other than the agricultural census would suggest otherwise. Some experts suggest that the decreasing trend observed in average farm size among farms in China has reversed, with average farm size having increased from 2004 to 2007, during which time farm consolidation occurred (Jia & Huang, 2013). Regardless of whether consolidation has already begun, some experts argue that it is likely to begin or continue to occur given current changes in land policy which are facilitating private ownership (as opposed to merely use) of agricultural land by individuals (Nie & Fang, 2013). Should individuals be able to own (rather than simply use) their land, sales of land will be facilitated and consolidation will become much easier. Given the sheer amount of agricultural land in China, what happens in terms of average farm size in that country will be a major determinant of the trend in average farm size observed for low- and middle-income countries as a whole. Evidence on demographics as well as average farm sizes suggests that the trend towards decreased farm sizes continues in Africa, but that consolidation may have begun in Asia (Masters, et al., 2013).

Figure 3: Average farm size over time in Australia and China

Sources: Author's compilation using FAO (2013a) and (Government of China, 2009).

As we have seen, average farm size has decreased in most low- and middle-income countries and for the world as a whole over the period 1960 to 2000. At the same time there has been an increase in the total amount of agricultural land used worldwide (from 4.5 to 4.9 billion hectares from 1961 to 2010 (Table 4). This would suggest that globally the total number of farms has increased over that time period as well.

7. How large are the world's farms?

The World Census of Agriculture recommends standardized size classes for countries to follow in reporting the results of their census; however, there is some variation in terms of how closely countries adhere to them. For the 1990 and 2000 round census, FAO has compiled international comparison tables which provide information on farms by size and area in as standardized a format as possible; in compiling the tables, some interpolations and other methods were used to provide the best possible estimates of the number of farms in each size cohort for each of the countries

concerned (see, for example the notes to Annex 6). For example, according to WCA guidelines the smallest size cohort should be farms smaller than 1 hectare. However, some countries, especially several of those located in Latin America and the Caribbean or classified as high-income, use less than 2 rather than 1 hectare as the smallest size class. The less than 2 hectare sized farms are reported in the 1 – 2 hectare category when making cross-country comparisons. For more on the methodologies used, see FAO (2013a) and FAO (2001).

We combine data from the international comparison tables for the 1990 and 2000 rounds of the WCA (FAO, 2001) and (FAO, 2013a)). We are thereby able to consider farms by size for a sample of 111 countries and territories with a total of nearly 460 million farms (Figure 4 and Annex 5). This sample represents at most 80 percent of the world’s farms as well as about 80 percent of the world’s population, 85 percent of the population active in agriculture and 60 percent of agricultural land worldwide (FAO, 2014). Seventy-two percent of the farms are smaller than one hectare in size; 12 percent are 1 to 2 hectares in size and 10 percent are between 2 and 5 hectares. Only 6 percent of the world’s farms are larger than 5 hectares. Assuming this average is representative of the land distribution worldwide, we estimate that there are more than 410 million farms less than 1 hectare in size and more than 475 million small farms that are less than 2 hectares in size³.

Figure 4: Share of farms worldwide, by land size class

Notes: The figures are based on the most recent available estimate for each country from the World Agricultural Census 1990 and 2000 round.

Sources: Authors’ compilation using data from (FAO, 2013a) and (FAO, 2001). See Annex 5.

8. What can we say about farmland distribution?

We now consider how the world’s farmland is distributed among farms. Estimates of the share of farmland controlled by the various farm size classes are available for 92 countries and territories once we combine data from international comparison tables for the 1990 and 2000 rounds of the WCA (Annex 6). This sample of 240 million farms represents 42 percent of the world’s farms, as well as about 56 percent of the world’s population, 43 percent of the population active in agriculture and

³ More than 570 million farms multiplied by 72 and 84 percent, respectively.

38 percent of agricultural land worldwide (FAO, 2014). We cannot claim that this sample is representative of the world's farmland distribution. It does not include China, thus omitting about 35 percent of the world's farms; the Russian Federation is likewise not included. It undersamples countries in Sub-Saharan Africa and the low-income category, with only 9 and 7 countries in each group, respectively.

We nevertheless are able to observe some instructive patterns considering the farmland distribution by region in the low- and middle-income countries (Figure 5). In all regions, except Latin America and the Caribbean, the majority of farms are in the smallest cohort (smaller than 1 hectare in all except the high-income group where the smallest cohort is less than 2 hectares). Despite their being the majority in most regions, farms in the smallest cohort control only a small share of farmland. The distribution of farm sizes and farmland seen for the 9 countries located in Sub-Saharan Africa is similar to that of the 3 South Asian countries, where about 60 percent of farms are smaller than one hectare and control close to 20 percent of the farmland; in those regions few farms reach a size larger than 50 hectares and the few that do comprise only a small share of total farmland. The distribution observed for the 9 countries in East Asia and the Pacific (excluding China) is also quite similar, with about 50 percent of farms being smaller than one hectare and representing about 12 percent of farmland, and farms rarely reaching sizes exceeding 100 hectares. In each of those 3 regions farms up to 5 hectares in size represent at least 90 percent of the total number of farms and cover more than 50 percent of the agricultural area. In Latin America and the Caribbean the pattern is radically different. There are relatively fewer very small farms and the bulk of the land is operated by a small number of very large farms. Farms in Latin America and the Caribbean are often quite large, with a few very large farms exceeding 1000 hectares in size and representing nearly half of the total farmland. In the Middle East and North Africa, 60 percent of all farms are below 1 hectare, but more than 50 percent of the land is farmed by holdings above 10 hectares in size.

Figure 5: Average distribution of farms and farmland area by land size classes and region

Notes: Country groupings are the same as those used by the World Bank (2011), with the following additions: Cook Islands were classified as East Asia and the Pacific; French Guiana, Guadeloupe, and Martinique as Latin America and the Caribbean; and Réunion as Sub-Saharan Africa. Number of countries shown in parentheses. See Annex 6. Source: Authors' compilation using (FAO, 2013a) and (FAO, 2001).

Agricultural land distribution follows a pattern based on a country's income level as well as its regional grouping. For nearly all income levels we see that, on average, the majority of farms (between 40 and about 80 percent) are smaller than 2 hectares; they control anywhere from a few

percent to about 40 percent of farmland (Figure 6). The share of farms represented by the larger cohorts would seem to increase with each income category. For example, farms greater than 5 hectares in size constitute only 27 percent of the farmland in low-income countries, 43 percent in the lower-middle-income countries, 96 percent in the upper-middle-income countries and 97 percent in the high-income countries. In short, it would appear that both average farm size and the share of farmland controlled by larger farms are higher in countries with larger average incomes.

Figure 6: Distribution of farms and farmland area by land size classes and income group

Notes: Country groupings are the same as those used by the World Bank (2011). Number of countries shown in parentheses. Sources: Authors' compilation using (FAO, 2013a) and (FAO, 2001). The figure uses all data presented in Annex 6, with the exception of data for those countries for which the World Bank provides no income classification; these are: the Cook Islands; French Guiana, Guadeloupe, Martinique and Réunion.

We now present a figure showing farmland distribution for all 92 countries in the sample underlying Figure 5. The results must be interpreted with caution, however, since the sample is not representative at the global level; it represents only about 240 million agricultural holdings, which is less than half of the world's farms. For the 92 countries, we find that the majority of farms are less than 2 hectares in size and they only comprise a small share of the total agricultural land worldwide. That is, nearly seventy five percent of the farms in that sample are smaller than two hectares; and they cover only 7 percent of agricultural land (Figure 7). Conversely, 25 percent of farms are larger than 2 hectares and cover 93 percent of the total agricultural area.

Figure 7: Distribution of farms and farmland area by land size classes, 92 country sample

Sources: Author’s compilation using FAO (2013a) and FAO (2001). See Annex 6.

As we saw earlier, the 92 country sample (see annex 6) is not representative of the world’s farms; perhaps most noticeable is the absence of China. We are however, able to estimate what farm distribution looks like in China and in an additional 13 countries, which are: Canada, French Guiana, Guinea Bissau, Indonesia, Libya, Malawi, Mozambique, New Zealand, Slovakia, Slovenia, Spain, St. Kitts & Nevis and Viet Nam. As shown in Annex Table 5, we have information on the number of farms by farm size class as well as the total farmland operated nationally in those 14 countries. We assume that the average farm size is the midpoint of each cohort; that is, in each of the countries the farms in the 0 to 1 hectare cohort average 0.5 hectares; those in the 1 – 2 hectare cohort average 1.5 hectares, etc. The hectares of farmland in the largest farm size class reported by each country is calculated as the difference between the total number of hectares of agricultural land in the country and the sum of the hectares of land in the smaller land size classes (using the midpoint assumption).

Adding the thirteen countries (but not China) to the 92 country sample we have a total of 257 million farms or about 45 percent of the farms worldwide (Figure 8). Of those farms:

- 74 percent of the farms are smaller than 2 hectares, but only control about 8 percent of the world's farmland.
- Conversely, 26 percent of the farms are larger than 2 hectares; they control 92 percent of the farmland.

Figure 8: Distribution of farms and farmland area by land size classes, 105 country sample

Sources: Authors’ compilation using FAO (2013a) and FAO (2001). See Annexes 5 and 6.

We use a similar approach to include China in the description of farmland distribution. Considering China we now have a 106 country sample a total of 450 million farms, which represent 80 percent of the world's farms⁴. These countries comprise about 85 percent of the world's population active in agriculture as well as about 80 percent of the world's population and 60 percent of agricultural land worldwide (FAO, 2014). Notable omissions are Australia and the Russian Federation.

Figure 9 shows estimates of the share of farmland area falling in each of the land size classes. It shows that:

- 84 percent of the farms are smaller than 2 hectares and they operate about 12 percent of the farmland.
- Conversely, 16 percent of the world's farms are larger than 2 hectares and they represent 88 percent of the world's farmland.

Figure 9: Distribution of farms and farmland area by land size classes, 106 country sample

Sources: Authors' compilation using FAO (2013a) and FAO (2001). See Annexes 5 and 6.

Although farmland distribution may be considered quite unequal at the global level, this is not the case for some income and regional groups. In countries at lower levels of income smaller farms operate a far greater share of farmland than do smaller farms in the higher income countries. This is perhaps best illustrated by considering the share of farms and farmland represented by farms 5 hectares and smaller. Globally, about 95 percent of farms are smaller than 5 hectares and they operate about 20 percent of farmland. In low- and lower-middle-income countries as well as, East Asia and the Pacific (excluding China), South Asia and in Sub-Saharan Africa about 95 percent of farms are smaller than 5 hectares, and they operate the majority of land in those countries. In upper-middle-income countries (excluding China), high-income countries, Latin America and the Caribbean and Middle East and North Africa the majority of farms are likewise smaller than 5 hectares in size, but they operate less than 10 percent of farmland.

⁴ 450 divided by at least 570 million farms.

9. Conclusions

In conclusion, using agricultural census data we see the following:

- There are more than 570 million farms in the world and more than 500 million of these are owned by families. Family farms represent the vast majority of farms in the world, but less of the share of the world's farmland, which means that they are, on average, smaller than non-family farms.
- Most of the world's farms are very small. Worldwide more than 475 million farms are less than 2 hectares in size and more than 410 million farms are less than 1 hectare in size.
- Average farm sizes have decreased and the total number of farms increased from 1960 to 2000.
- Data on farmland distribution are missing for several countries where many of the world's farms are located, but we may nevertheless conclude that although the vast majority of the world's farms are smaller than 2 hectares, they control only a small share of the world's farmland.
- The most comprehensive possible estimate of farmland distribution worldwide suggests that:
 - 84 percent of the farms are smaller than 2 hectares and they operate about 12 percent of the farmland.
 - Conversely, 16 percent of the world's farms are larger than 2 hectares and they represent 88 percent of the world's farmland.
- Although farmland distribution would seem quite unequal at the global level, it is less so in low and lower-middle income countries as well as in East-Asia and the Pacific (excluding China), South Asia and Sub-Saharan Africa.

These estimates are in many ways the most complete description of farms and farmland worldwide, but they do have serious limitations. Efforts to enhance the collection of up-to date agricultural census data, including data on farmland distribution are essential to our having a more representative picture of the number of farms, the number of family farms and farm size as well as farmland distribution worldwide.

Notes: For estimates from the 2000 round of the WCA, interpolated data are printed in bold; and the figures in shaded cells refer to size classes represented by the continuum of shaded cells. Interpolations and continuums are not shown for estimates coming from the 1990 round; that information may be found by referring to FAO, 2001.

ESA Working Papers

WORKING PAPERS

The ESA Working Papers are produced by the Agricultural Development Economics Division (ESA) of the Economic and Social Development Department of the Food and Agriculture Organization of the United Nations (FAO). The series presents ESA's ongoing research. Working papers are circulated to stimulate discussion and comments. They are made available to the public through the Division's website. The analysis and conclusions are those of the authors and do not indicate concurrence by FAO.

AGRICULTURAL DEVELOPMENT ECONOMICS

Agricultural Development Economics (ESA) is FAO's focal point for economic research and policy analysis on issues relating to world food security and sustainable development. ESA contributes to the generation of knowledge and evolution of scientific thought on hunger and poverty alleviation through its economic studies publications which include this working paper series as well as periodic and occasional publications.
